

PREGNANCY, FERTILITY, AND THE COVID-19 VACCINE

If you are pregnant, you should consider being vaccinated for COVID-19.

According to both the Centers for Disease Control and Prevention (CDC) and the American College of Obstetricians and Gynecologists (ACOG), it is safe for pregnant and breastfeeding women as well as women considering pregnancy to be vaccinated for COVID-19. However, getting vaccinated is a personal choice and should be a decision made after discussing it with your health care provider.

CURRENT FACTS ABOUT THE COVID-19 VACCINE AND WOMEN WHO ARE PREGNANT OR BREASTFEEDING:

Currently, there is no evidence that COVID-19 vaccination causes any problems with pregnancy, including the development of the placenta.

While limited, current safety data on the use of COVID-19 vaccines in pregnancy does not indicate any safety concerns.

More than 130,000 women indicated they were pregnant when they received the COVID-19 vaccine. Of those, 5,000 are enrolled in the government's v-safe program to monitor the effects of vaccination on pregnancy. Data analysis from earlier this year did not identify issues.

Breastfeeding is rarely a safety concern with vaccines, and the three authorized COVID-19 vaccines are not thought to be a risk to a breastfeeding infant. Also, according to ACOG, when breastfeeding mothers get vaccinated, they produce antibodies that can be passed through breast milk and help protect their children from the virus.

Pregnant women are at increased risk for severe illness and hospitalization from COVID-19. Vaccination can significantly reduce or even prevent these risks.

WHAT IF I'M NOT PREGNANT NOW BUT WANT TO BE AT SOME POINT IN THE FUTURE?

- **No loss of fertility has been reported** among vaccine trial participants or the millions who have received the vaccines since their authorization, according to ACOG.
- ACOG has also found no evidence that the vaccine can lead to loss of fertility, saying **"it is scientifically unlikely."**

IF YOU RECEIVED A COVID-19 VACCINE WHILE PREGNANT, CONSIDER PARTICIPATING IN THE V-SAFE PREGNANCY REGISTRY.

The v-safe registry is the CDC's smartphone-based tool that uses text messaging and web surveys to provide personalized health check-ins after vaccination. It has been established to gather information on the health of pregnant women who received a COVID-19 vaccine. If those enrolled in v-safe report that they were pregnant at the time of vaccination or after vaccination, the registry staff might contact them to learn more. Participation is voluntary, and participants may opt out at any time. **Register on your smartphone, at vsafe.cdc.gov/en/.**
